Abstract (en)

Suspension device for a supporting profile (20) of a ceiling. The device consists of a top elongated bearing part (4) and a bottom bearing unit (1), consisting of a bottom elongated bearing part (2) of flat material, and a resilient bracket (3) with diverging legs (5a, 5b), each with an opening (8a, 8b). The top bearing part (4) is inserted through the openings (8a, 8b) of the bracket legs (5a, 5b) and is fixed in the openings (8a, 8b) as the result of tilting and the resilience of the bracket legs (5a, 5b). The bottom bearing part (2) has a bottom suspension end which is suitable for suspending the profile (20) therefrom. After coupling of the bottom bearing unit (1) to the supporting profile (20), the legs (5a, 5b) of the bracket (3) extend essentially at right angles to the profile (20). The bottom suspension end of the bottom bearing part is formed as a hook (11) with an upward bent lip (13) parallel to the flat material of the bottom bearing part (2). The hook (11) is suitable to be inserted through an opening (25) of a vertical part (21) of the supporting profile (20). The bottom bearing part (2) has a resilient tongue (14) bent towards the side of the lip (13), and a bottom end of which is a free end and ends just above the vertical part of the profile (20). <IMAGE>
