Abstract (en)
[origin: EP0653598A1] A refrigerator (1) has a body part (2) which bounds a cooling compartment and to whose one side wall (4) a refrigerator door is linked. Height-adjustable shelves (7) are mounted on the inner sides of the side walls (4) of the cooling compartment. In order to design these shelves to be extensible with the possibility of any desired height adjustment, the side walls (4) are provided, in mutually parallel, horizontal planes, with in each case two catch recesses (5) which are arranged spaced apart and are provided with sloping or rounded portions in the direction of the opening side of the refrigerator. The lateral front edges of the shelves (7) have guides consisting of grooves (12) in which in each case a slide-like element (13) is displaceably guided, which is provided on both sides, via resilient connecting pieces (17, 18), with catch projections (19, 20) which drop into the catch recesses (5). The engagement of the catch projections (19, 20) in the catch recesses (5) is releasable after cancellation of a retention by pulling out the shelf (7) with the slide-like elements (13). <IMAGE>
