Abstract (en)

[origin: FR2706202A1] The invention relates to a device for the simultaneous ejection of two fluids, particularly pyrotechnic fluids, intended to react by mutual contact after their ejection. Provided for each fluid (1, 2) is a reservoir (121, 21) opening out on the outside of the device via a respective nozzle (124, 118). The two reservoirs (121, 21) consist of a respective cylinder (129, 27)/piston (49, 7) assembly, and the simultaneous ejection of the two fluids (1, 2) is caused by the controlled displacement of one (7) of the pistons (7, 49) within the corresponding cylinder (27) and mechanical coupling between the pistons (7, 49). The ejection rates conform to a constant proportion defined by the cross-section of the piston (7, 49), whatever the degree of filling of the reservoirs (21, 121). <IMAGE>
