Abstract (en)

[origin: EP0654807A2] The invention relates to a stacked cam switch, having a baseplate (10) on which at least one cam disc (22, 41), which is coupled to a switching shaft, for in each case one switch element (34, 44) is mounted such that it can rotate, in each case one driver disc (17, 40) being integrally formed between each cam disc (22, 41) and the switching shaft, which driver disc (17, 40) can be coupled in a rotationally fixed manner to the cam disc (22, 41) in different positions. The driver disc (17, 40) is coupled in a positively locking and rotationally fixed manner to the switching shaft so that the rotational movement of the switching shaft is transmitted via the driver disc (17, 40) to the cam disc (22, 41), and by the cam disc (22, 41) to the associated switching element (34, 44). <IMAGE>
