Abstract (en)

[origin: DE4319398C1] In a sterilisation test device comprising a reception chamber for an indicator and a feed line for the sterilisation atmosphere to the reception chamber, the reception chamber being sealed or sealable relative to the sterilisation atmosphere, the invention proposes that the feed line be of helical design and be arranged inside a housing. As a possible structural form the invention proposes that the feed line be formed by a threaded rod inside a threaded bore, a recess extending around the entire circumference being provided in the flanks of the screw thread of the threaded rod and/or of the threaded sleeve. This results in the creation of a test device which has small structural dimensions, permits reliable display of the test result and offers a high degree of protection against intended or unintentional manipulations.
