Abstract (en)

A shoe sole (1) structure for effecting an increased exercise to the wearer of a shoe with the shoe sole as well as the high shock-absorbency. The shoe sole (1) of the present invention comprises a rear sole section (2) forming a recess heel, a forward sole section (3) forming the grounding bottom of the shoe sole (1), and an intermediate sole section (4) between the forward and rear sole sections (3 and 2). In the intermediate sole section (4) a wedge-shaped cushion member (5) is inserted to give the increased shock-absorbency and the constant coziness to the associated shoes while stimulating the arches of the wearer's foot with acupuncturing pressures. A return panel support (6) is buried in the rear sole section (2) to prevent the drooping of the recess heel assuring the constant coziness of wearing the associated shoes. In addition, the forward sole section (3) has at its rear side two or more grip members (9) to prevent the possible slippages of the shoes in the walking activity and also to tighten the cushion member (5) in the shoe sole (1). <IMAGE>
