Abstract (en)
[origin: EP0655546A2] The invention relates to a turnstile arrangement having a blocking element which exhibits wings which extend away from the axis of rotation, having a directing element which extends, peripherally with respect to the turning circle of the blocking element, approximately over a circumferential angle corresponding to the angle between adjacent blocking-element wings, and having a blocking screen which extends, on the side remote from the directing element, into the turning circle of said blocking element. In the case of said turnstile arrangement, the directing element is designed to be of a height which is approximately hip level, and adjoining this on the side remote from the blocking element there is arranged a through-passage which can be released and closed off by means of at least one door element and is intended for taking through bicycles. <IMAGE>
