Abstract (en)

[origin: WO9404882A1] Proposed is a device for camouflaging military equipment, the device consisting of a frame, which carries camouflage netting or similar camouflage equipment, and elastically or plastically deformable arms (1). In order to ensure that the device is simple to handle, each of the two ends of the elastically or plastically deformable arms (1) is attached to a connector element (2, 12, 22). When the two connector elements (2) are brought closer to each other, an irregular structure is formed virtually automatically, the shape of which can be altered in a variety of ways.
