Abstract (en)
The system is based on the use of two bodies (1) and (2) provided with projections (3) staggered with recesses, complementary in both bodies to permit pressure coupling of both bodies (1) and (2), with the possibility of axial movement to enable disassembly thereof. The bodies (1) and (2) can be made out of any suitable material and form together the structure corresponding to a closure of a window, door or the like, in such a way that the body (1) will constitute the part considered as external and body (2) will form the internal part of that structure, any of them being interchangeable as they are removable. In the case of structures with a thermal bridge any of the bodies (1) and (2) or both of them can constitute that which is the thermal bridge and can be fastened to the sections that will constitute the internal and/or external parts. The possibility of this coupling of the bodies (1) and (2) permits any of the parts or bodies that form the closure to be interchanged, while the remaining ones are maintained. <IMAGE>
