Abstract (en)
[origin: DE4228928C1] Signal lamps, in particular for motor vehicles, have a light source, a housing and a transparent coloured closure, preferably red, as well as one or several light filters arranged between the light source and the closure face. In order to obtain on the one hand a more intensive colouring of the closure when the light source is switched off, and to reduce, on the other hand, light losses, the closure has a continuous colouring, is subdivided into segments of different thicknesses and the light filter is provided with recesses.
