Abstract (en)

A method of manufacturing an antenna or inductive component comprises producing (eg by injection moulding) a former (10) of an electrically insulating material which has a groove (12) in its surface. A layer (14) of electrically conducting material is deposited over the surface of the former and this layer is then removed from the surface of the former excepting the groove. Hence, the former is left with an electrically conducting element extending along the base of the groove. <IMAGE>
