Abstract (en)

[origin: EP0660288A1] A control module is described for a radio receiver which receives and decodes the information which is transmitted in a coded manner in the radio-data-system (RDS) in its traffic-message-channel (TMC). The control module which is intended to offer access to the transmitted information, which is as easy as possible, has an information key and/or a regional key and/or memory keys. A plurality of functions can be triggered by means of the information key. The regional key and the memory keys offer access to information from selected areas. <IMAGE>
