Abstract (en)

[origin: EP0660462A1] An incandescent lamp socket is illustrated and described, whose conductor connecting block at the rear is of particularly slim-line construction. This results in free spaces at the sides, which can be used, for example, in order to lay connecting conductors within a thin light housing. A radiator light using this lamp socket is distinguished by extremely small construction. The surfaces of a pot-like housing or of the light body and of a section of the lamp socket can be connected to one another without any seams. The lamp socket itself becomes the component of the light which governs its shape. <IMAGE>
