Abstract (en)

[origin: WO9407025A1] In order to further reduce the design complexity of and emissions from a multi-cylinder internal combustion engine (M) with a starter-generator (ST) couplable via a flywheel (FW), when the engine (M) is started by means of the flywheel (FW), only some of the cylinders (1; 2) are connected at first; the other cylinders (3; 4) are disconnected or operated together without any compression resistance.
