Abstract (en)

[origin: WO9418420A1] A device for temporarily supporting an outer wall or boundary wall of a building, comprises two lateral supports (1) having anchoring means (2, 2') for anchoring the supports (1) in walls of the building adjacent the outer wall (A, B). These lateral supports (1) carry a suspension structure (3, 4) extending therebetween. A carrier (9, 11, 12) suspended from the suspension structure (3, 4) carries the outer wall in a plurality of points. In this manner, the space below the part of the outer wall to be supported remains free from stays so that the work on the outer wall is not hindered.
