Abstract (en)
[origin: EP0662556A1] There is a slide (6) in the box-shaped housing (1). It is operable from the rotatable ward (4) of a cylinder (5) which is displaceable parallel to the axis of the locking bolt (3) and via a thrust link engages on a one-armed lever (7). The lever with its one end is pivotably located around an axis (8) on the housing. This axis runs at a distance from the locking bolt vertically to its axis and with its other end (9) extending over the slide engages in a driver recess (10), which is formed at the housing inner end of the locking bolt. The pivot axis of the one-armed lever is arranged close to the long side (2) of the box-shaped housing from which the locking bolt emerges.
