Abstract (en)
[origin: EP0663154A1] The boot has a rigid shell (5) and a leg (2) with a front (3) and back part (4). The back part pivots backwards and forwards on the shell, and is locked in position or released by a cylindrical plate (11) which is moved angularly in a corresponding recess (12) in the back (5a) of the shell. The plate is set radially around with holes (13A). A finger (14) on the leg engages in one hole, being moved by a lever (15) on the outside of the boot. The position of the plate is adjusted by a tool (20) which engages in a central slot (21).
