Abstract (en)

[origin: EP0663289A1] The method involves filling of cavities with a fluid by means of a chamber arranged along the cover of the cylindrical body (1) with an inner space (4) having a circular cross-section. In the formation of the inner space, a chamber body forms, and the inner space on the face side is closed by side walls and has a colour inflow. The inner space is obstruction-free and permits the formation of a fluid roller (25) set in rotation by the rotating cylindrical body. The fluid inflow and a fluid outflow are arranged opposite to one another and concentric to the inner space (3) in the side walls.
