Abstract (en)

A lubricating material (1) for the extraction of a temporarily buried reinforcement is proposed which excels in workability at the site of construction, allows the temporarily buried reinforcement (22) to be easily extracted and recovered from a cement layer (23), and enjoys outstanding economy. This lubricating material enables the temporary reinforcement (22) buried in the cement layer (23) to be easily separated from the cement layer (23) after the cement has been hardened. This lubricating material (1) comprises a water-absorbent polymer sheet having a water-absorbent polymer directly fixed in a substrate. <IMAGE>
