Abstract (en)

Fence panel, in particular for use as a fence gate. It comprises a frame constructed of profiles (1,2,3,4) and a wire mesh (5) which covers the opening within the frame. The panels can be assembled on site with bolts and are exceptionally strong. For this purpose, the profiles have special corner joints, whereby the head of the one profile end (21) rests against the side wall of the other profile end (22). The corner joint is then formed by a number of bolts (34,35), each of which runs in the longitudinal direction of the first profile end (21), from a bolt head (36), through the second profile end (22) and further on into the first profile end (21), where the bolt (34,35) is secured by screwing into a pin (46). This pin (46) runs straight through the first profile end (21). The passageway through the second profile end (22) possesses a compressive resistance in the longitudinal direction which is of the same order of magnitude as the tensile resistance of the bolt(34,35). <IMAGE>
