Abstract (en)

[origin: EP0665344A1] The method uses at least two building plate components (2,3) which are so displaced in relation to one another and connected to form a building plate (1), that through the displacement on three side edges a stage rabbet (4,5) is produced. The components are again so arranged in relation to one another that on a fourth side edge the second component (3) extends over the first (2). The components are adhered to one another to form a building plate. The building plate along three side edges has a stage rabbet evolving from the first component and along a fourth side edge a stage rabbet evolving from the second component.
