Abstract (en)  
[origin: WO9409220A1] The object of the invention is an interlocking element intended for joining together building boards or sheets L1 and L2, and comprising a component A to be fastened to L1, and a component B to be fastened to L2. The cross-sectional profile of component A consists of part (a) which extends into the construction, and of part (b) which continues from part (a) and is oriented towards the centre of L1, and of part (c) which continues from part (b), bending 180 DEG and running in the opposite direction with respect to part (b), towards the joint seam (s) between L1 and L2. Component B comprises a part (m) which extends into the construction. According to the invention, component A in addition consists of part (d) which continues from part (c) in the shape of a Z-profile, and remains on the other side of the joint seam (s). Together parts (a) - (d) form an integrated piece. When components A and B are fastened to adjacent building boards or sheets, components A and B can be joined together by means of a clamping device K passing through L1. The point of the clamping device is pressed against the part assembly (bc) of component A, in which case part (m) of component B, fastened to L2, is clamped in the joint seam (s), as the lower arc of part (d) is pressed towards parts (a) and (m).
