Abstract (en)
[origin: EP0666092A1] The handle which has a clamping device with two jaws (2,3) for fixing the two skis is mounted on a housing (1) of one jaw to swivel up from a rest position against the housing into a carrying position parallel to the side of the ski. The handle is coupled to a servo drive (10). As the handle swivels up the servo drive tensions through the tensile rod (6-9) engaging between the track faces of the ski the second outer jaw (3) with the skis against the tension jaw (2) of the housing. A locking device (16-19) for the servo drive engages in the tension position of the tensile rod and can be moved into the release position through a handle (19).
