Abstract (en)

[origin: EP0666553A1] Into the channel (6) extends stop components for the irreversible locking of the end of a bendable strip (1) provided with catchment components (5) introduced into the channel. The other end of the strip is fixed non-releasably on or in the seal body (2). Out of the seal body extends a tear-off lobe (3), which with one part extends through an opening in the seal body. On this part in the interior of the seal body the stop components are formed, and only straight via theoretical break points is connected with the seal body, in such a way that by a force exerted on the tear-off lobe the lobe breaks away, thereby irreversibly disturbing the locking of the strip, releasing its secured end.
