Abstract (en)
[origin: WO9409221A1] An insulated construction panel (1) is formed from a cementitious material, usually Portland cement concrete, and reinforced with reinforcing fibre, usually steel reinforcing fibre. After the first layer of fibre reinforced concrete (2) has been vibrated in a suitable mould a sheet of insulating material (3), usually sheet polystyrene, is laid in place bearing structural areas at each end of the panel (4, 5) and cover strips (7) down the sides of the panel. Additional reinforcing rods (8) can be placed in these parts. The panel is completed by fitting the mould with more fibre reinforced concrete so that the insulating material is embedded and the structural sections at each end of the panel complete. The completed insulated construction panels can be used to build typhoon proof dwellings and community buildings. The panels are supported in an upright position upon pads laid below ground level on the building profile. The panels can be abutted, i.e. at corners or spaced apart for building components such as doors or windows. The erected panels are bound in with a reinforced concrete floor and joined together at the top by a structural member which also can be fixed to the roof structure.
