Abstract (en)

[origin: EP0667301A1] The distributor (D) for a liquid or pulverulent product (P) comprises a product container (1) with a neck (2) and a top (4). The top has an applicator (7,8) which plunges into the container when the top is closed on the neck. The container neck has a pocket (10) in a deformable elastic material in which the applicator is housed when the top is fixed on the neck. This pocket has slots (12) which are opened when the pocket wall is subjected to a pressure force from the applicator when the top is in its normal closed position. The pressure force exerted by the applicator on the pocket wall has a component orthogonal to the axis (A-A). The direction of the slots in the pocket wall present a component in the same plane as the pocket axis. The applicator has transverse dimensions such that during fixing of the top on the container the applicator causes lateral inflation of the pocket wall and opens the slots.
