Abstract (en)

[origin: EP0667440A1] The electronically controlled blind or shutter (11) can be programmed to provide opening and closing at selected times of day. A selector (28) provides mode selection, e.g. manual, automatic, set times, set positions. The controller (27) provides output to operate the motor and positions are fixed by a position sensor (12) with the output compared (14) with the set reference. Values of time are stored in memories (18,19). Changeover between operating and programming modes are selected by operating switches (25,26).
