Abstract (en)

[origin: WO9411794A1] An arrangement (10) is disclosed for developing a control program for a knitting machine or loom (42) used to produce hosiery in which the thread runs across the knitting direction. The arrangement has an input unit, a graphics unit and a control program calculating unit. In order to make it easier for the user of the arrangement to convert input information about the weave pattern to be knitted into a knitting control program, the input unit is designed to allow inputting and/or placing weave, colour and/or contour patterns. An adapter unit (28) for weave arrangements with at least two different patterns following each other in the direction of the stitch rows checks whether the patterns can be knitted.
