Abstract (en)
[origin: WO9411833A1] An information system for displaying prices of articles on display units adjacent to the location of the articles at a point of sale comprises a number of detached display units, which reproduce information, which is changeable by means of a wireless communication from a central computer or a portable terminal. A problem related to information systems of this type consists in easily and conveniently providing means for assigning an identification code corresponding to a particular article to a display unit. According to the invention this is achieved by a control unit, integrated within the display unit, being able to be set by means of an external switch or signal, the control unit in such set state being arranged to receive and to store an identification code transmitted from the portable terminal.
