Abstract (en)

[origin: US5660416A] The clamping device for connecting a snowboard formed from two skis and a center part has a connection member which is supported on the center part so as to be swivelable around a swivel pin, this connection part having hooks formed at its ends which define corresponding receiving openings. Hardware fittings are arranged on the skis, wherein a movable hardware part is supported on a hardware part that is held on the ski in a stationary manner. Each movable hardware part has an eccentric with which hooks cooperate so as to effect a clamping after the rotation of the movable hardware parts and the compulsory rotation of the eccentrics.
