Abstract (en)  
[origin: WO9508284A1] The invention relates to a chair, especially an office chair, with a seat (1) which can swivel about a first horizontal axis (K) and a squab (2) capable of swivelling about a second horizontal axis (H). The chair also has a support (5) securing the seat. The first axis (K) runs at least approximately through the user's ankle. The second axis (H) passes at least approximately through the user's hip. This provides the best possible movement relationships, impossible in prior art chairs.
