Abstract (en)

[origin: EP0670507A1] The connection process involves using a multichannel connection block having several outputs (122,222) on a common surface (112,212) according to a predetermined arrangement with a carefully controlled spacing (p). The block is placed on a support (150,250) for mechanical positioning (152,155,252,255). The assembly is placed facing a complementary reference connector able to join with the mechanical positioning parts of the support. The reference connector has a rigidly attached reference block with optical fibres positioned as those on the connection block. The outputs of the connection block are aligned dynamically by three relative displacements between the block and its support. After alignment, the block is fixed on its support.
