Abstract (en)

[origin: WO9507136A1] A device is disclosed for coating small solid bodies. The temperature of rotating turbines that hurl outwards the liquid phase used for coating solid bodies is not suitable in the state of the art for tempering said liquid. To solve this problem, the turbine body (5) is supplied with a circulating heating medium through a hollow driving shaft (4). The heating medium allows the turbine to be tempered directly in the area in which the liquid to be distributed is located. The invention is useful for coating devices.
