Abstract (en)

[origin: WO9508717A1] The invention relates to a device for limiting the outflow and the simultaneous intermediate storage of waste water and the separation of depositable and floating substances from waste water in which there is a swirl chamber (2) connected to the intake (1) and designed in the natural spiral shape of the eddy which has round apertures (4; 6) at the top and bottom, and the top aperture (6) seamlessly connects with a rotation-symmetrical container (8) in which a feed pipe extends centrically from the top aperture (6) to just below the upper edge (10) of the container.
