Abstract (en)

[origin: WO9414073A1] The invention relates to a method for performing ELISA tests. Catastrophic errors occur during performing of immunological tests due to incorrect combination of ingredients used. The invention has for its object to avoid such errors. For this purpose the method according to the invention has the feature that the coated cups and the additive containers for the other test ingredients, for which particular calibration values of optical density or fluorescence are determined subject to concentration, each carry a code which designates these coated cups and other test ingredients as forming part of determined lot, and that the computer program is programmed to exclude production of a measurement value of a test with coated cups not forming part of the determined lot and/or other test ingredients not forming part of this lot.
