Abstract (en)

[origin: EP0672439A1] The device has support and binding parts for support of the ski shoe on the ski, with the wt. of the ski runner introduced via the support and binding parts or parts connected to them at least partly into the ski centre. The ski shoe (2) is supported in extension of the tibia of the leg of the skier vertically on the ski. The adjustment unit (7,8,9) is adjustable, and has support parts working in conjunction with one another. On through bending of the ski (1) for compensation of the occurring alterations of the distance between the ski shoe and the ski upper side the support parts execute a displacement analogous to the through bending.
