Abstract (en)

An awning mechanism comprising mounting means to be fixed to a wall or other structure to permit mounting of at least one supporting arm, the or each arm being pivotally attached to the mounting means so that it can move from a closed position in which it is parallel to the structure to an open position in which it extends outwardly and downwardly from the structure, the or each arm being fixed to the mounting means by a first joint which allows both outward pivotal movement about a first pivotal axis (13) and downward rotational movement of the arm, but which does not allow the first pivotal axis (13) to move horizontally relative to the mounting means, and a second joint spaced from the first joint in the vertical direction which allows outward pivotal movement of the arm about a second pivotal axis (15) and downward rotational movement of the arm, the second pivotal axis (15) being horizontally displaceable relative to the first pivotal axis (13). <IMAGE>
