Abstract (en)
[origin: WO9506532A1] This invention is concerned with an automatic feeding device for bar and/or metal rods for plants electrowelded normal or special meshes, shaped as per drawing, having its main characteristic to position at a required distance one or more pieces of said bars and/or rods. Device allows unilateral introduction continuous or by spaced pieces, transversally to the feeding sense of mesh construction. Continuous rod (1) is pushed by a bidirectional training device (2) and cut (1.1) to measure by the automatic shear (3), afterwards it is pushed through suitable gauged elastic guides (4), with the edge of the new bar against the end side of the previous bar (1.1), into required position on working surface.
