Abstract (en)  
[origin: CA2138293A1] For an electrical connector with a socket contact, formed by means of a sleeve body with attachment means for the connecting leads, for the displaceable reception of a contact pin, where a segmented cage, which can rest pressingly against the pin contact, is housed in the sleeve body so as to be fixed axially in position, the segmented cage (8) is formed by means of a cylindrically rolled flat sheet metal blank (9), whose longitudinal outer strips (10) are connected together by means of a number of ribs (11), which extend side by side separated from each other, the chamfered contact tabs (13), which are opposite one another at the longitudinal outer strips (10), project into the free spaces (12) between the ribs (11), whereby a first segment (13') of said contact tab curves in the direction of the central longitudinal axis of the segmented cage (8) and whereby a second segment (13''), formed by means of the free ends, is bent back and is shorter than half the length of the segmented cage (8), in order to ensure a reliable and effective contact.
