Abstract (en)

[origin: EP0675008A1] The packing machine is directly connected to the multiple output device (1) for the goods being packed (9) and to the multiple output device (11) for the internal packing (10). The connecting elements are common roll devices (4,4a) directly behind the output devices. The roll devices are also directly in front of the packing device (2), and have a drive which should guide the parts of the packing in opposite directions, without them blocking the machine. There are separate input regions behind the rolls. <IMAGE>
