Abstract (en)

[origin: EP0675250A1] A lock locates a connecting bar for a door or window. With the action of a single operation of the latch from the first to the second position, the latch is returned to the first position via the action of a spring. The connecting slide (13) to the connecting bar stays meanwhile in its locked position, and is only returned to the neutral position by once more operating the latch into the second position. A key actuated bolt (4) is only pre-closed in the locking position and is blocked in all other positions of the slide to the connecting bar. <IMAGE>
