Abstract (en)

A device is described, for the permanent connection, both mechanical and electrical, of a terminal (2) of electric and/or electronic components. According to the invention, a contact element is provided, being permanently elastic (1A), made of a foil of electrically conductive material, said contact element (1A) including an insertion zone for the terminal (2) defined by two opposite hemisurfaces (4), and a flexion slot (5) of the two hemisurfaces (4), contiguous to the contact zone, being able to consent the insertion of the terminal (2) in a stress condition of the hemisurfaces (4) within the elastic field of the material constituting the foil (1). <IMAGE>
