Abstract (en)

[origin: EP0676240A1] The grinding particles are fed by a fluidised conveyor stream (13) to a screen where the fine particles are discharged and at least a part of the coarser particles is returned to the grinding path. The ground particles spun out over the edge of the grinding path (5) are exposed to a helical current of the conveyor stream so that an enveloping flow is formed by the spun out particles in a helical upward movement whereby the streams of ground particles are moved in same. The spatial arrangement, structure and/or radial and vertical extension of the flow envelope is set with a controllable fluid conveyor stream which can be regulated by adjusting reinforcement bead segments (10) on the housing wall. The helical current can be produced by a fluid conveyor stream at a speed less than 30 m/s by a twist-producing gas guide unit (14). <IMAGE>
