Abstract (en)
[origin: EP0677307A1] The ski comprises a sliding surface (13) edged by squares. The body structure comprises an upper reinforcing layer (10) covered with an upper protection surface (9). On the top of the ski is an added structure (3) fixed in the rear part of the upper surface, in the zone which takes the heelpiece (7). This added structure ensures with a front stop (6) fixing for the skier's boot. This fixing is made by the intermediary of a sheet or plate (8) of visco-elastic material. The fixing screw (14) of the front zone of the added structure passes through it to fasten in the upper reinforcing layer. The rear zone of the added structure is glued onto the ski body structure by the sheet of visco-elastic material. The fixing screw (15) for the heel piece (7) is anchored in the added structure on top of the visco-elastic sheet. <IMAGE>
