Abstract (en)

[origin: WO9415621A1] Oligodeoxyribonucleotides, polydeoxyribonucleotides and derivatives thereof, such as defibrotide, are agents of genetic modulation at the levels of transcription, translation, secondary messengers and cellular signal transduction systems. Various disease states can be treated by modifying the dose of such agents in response to observed fluctuations (e.g., increase, decrease, appearance, disappearance) in normal, disease and repair markers.
