Abstract (en)
[origin: EP0678271A2] The suction regulation uses a controlled semiconductor switch (2), in series with the vacuum cleaner fan motor (1) and an associated control circuit, containing a comparator (28) for comparing an adjustable control signal and periodically varying signal, to provide the control pulses for the semiconductor switch. The control signal for the control circuit is manually adjusted to a required value and/or is switched between 2 different values via a pressure switch (40), the comparator receiving the control signal pref provided by an operational amplifier, receiving a sawtooth voltage synchronised with the supply voltage for the fan motor at its second input. <IMAGE>
