Abstract (en)

[origin: EP0678458A1] The dispenser/applicator has a fixed component (107) attached to the container of the product and a moving component (110) equipped with the applicator head. The two components are connected by flexible tongues (111) which allow the moving component to move axially relative to the fixed one, with the tongues lying in a plane perpendicular to the lengthwise axis and each connect at one end to the fixed component and at the other to the moving one. The fixed and moving components and the tongues, which are between two and twelve in number, are moulded in one piece from a thermoplastic material. The dispenser head has a porous dome for the application of the product, which is held in a pressurised container with a valve actuated by the moving component. <IMAGE>
