Abstract (en)  
[origin: EP0678840A2] The traffic information system operates with a central computer (ZR) that allows input of required destinations (1, 2) and also actual locations (3, 4) via the telephone network. Connections to the system by intending users can also be made directly (5) and this can indicate times of journey. Separate memory areas in the central computer system can be accessed by different users. Mobile telephone systems (MFI) may communicate via a base station. Traffic condition data can be displayed using access terminals (VB, KCI) located in houses, stores, restaurants, etc.
