Abstract (en)

[origin: EP0679513A2] The device has a pair of guide components (8-10) axis-parallel to the print cylinder (7). The guide components are so positioned by an adjustment mechanism that one of guides (9) during the feed of the print carrier (1) to the plate cylinder (7) and the other guide component (10) during the outward movement of the print carrier comes into contact with the print carrier. The guide components are a roller pair or are formed as runners or as roller-shaped segments. They are provided off-centre on a traverse (11). <IMAGE>
