Abstract (en)

[origin: EP0679783A1] The bracket consists of a pivoted base (1) with side wings (3) extending at right angles to it and notched to receive a rod. The base also has a branch (5) extending from and folded under it, and both the base and branch are slightly curved in shape, forming a U to engage with another component of the mechanism. The two side wings are joined by a third wing (10) which is bent up from the base at right angles to the first two and has its opposite ends (12) folded over and made with a notch (13) to match the notches (14) in the side wings. The notches in the third wing's ends have projecting tips (16) to hold the rod in place. <IMAGE>
